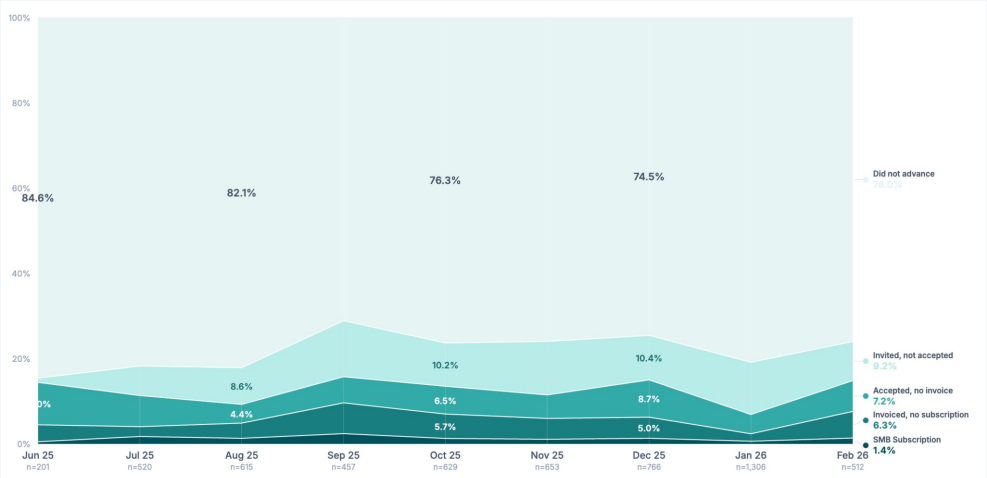
GTM Strategy for Accountants

# GTM Strategy for Accountants

*Multicuenta funnel performance & where to optimize*

## SMB Conversion Funnel by Payment Cohort

100% stacked area — share of total clients created reaching each funnel stage
Jun 2025 – Feb 2026



## Competitive Window

**Contalink** gains traction via tax-compliance features (RFC certification, compliance opinion), not accounting. Weak SMB offering.

**Alegra advantage:** Full SMB stack (inventory, POS, CRM) that Contalink doesn't have. Cloud competitors can't give away the only product they sell.

**No clear winner yet.** Most accountants will migrate from legacy. First-mover with a compelling model captures the market.

**Challenge:** We have not yet been able to convert SMBs invited by accountants, nor have we effectively driven accountants to invite their SMB clients.

**Goal: 5,000 accountants by year-end (vs. ~600 today).**

# Proposed Model Shift & Experiment

*Free for accountants + revenue share for SMB acquisition*

## Model Comparison

**Current Model**

Accountant pays

**$990 MXN/mo**

SMB freemium
10 invoices/mo limit

→

**Proposed Model**

Accountant free

**$0**

Rev share per SMB
**~$10 USD/activated**
SMB pays Alegra plans

## Hypotheses to Validate

**H1** Removing cost + adding economic incentives increases accountant conversion from ~3% to ~6%+

**H2** Revenue share motivates accountants to actively invite and activate SMBs

**H3** Billing-only as an entry-point plan reduces friction for SMBs to enter the ecosystem

**Risks**: Product not yet at par with Contalink in tax capabilities. SMBs fail to activate. Low-quality accountants attracted only by the free offer.

## Live Experiment (Mar 18 – Apr 18)

1. 1 sales rep offers Multi-RFC at no cost to accountant
2. Revenue share: ~$10 USD per activated SMB
3. Measure conversion vs. reps using paid model
4. Safeguard: rev share suspended if SMB doesn't pay

## Board Discussion

| | |
|---|---|
| **Risk appetite** | Willing to sacrifice short-term rev (~200 accountants at ~$50 USD) if experiment scales? |
| **Success thresholds** | What conversion rate justifies going all-in? What SMB volume validates the model? |
| **Product vs. GTM** | Wait for product parity with Contalink, or run in parallel accepting friction? |

# Discussion

## Product Benchmark in Mexico

# Product Benchmark — Alegra MX vs. Contalink

*Based on field research with Mexican accountants · March 2025*

Alegra leads | Closing gap | Open gap

| Feature | Alegra MX | Contalink | Gap |
|---|---|---|---|
| **XML download from SAT** | Reliability fixes in progress · auto-sync launching | Faster, more reliable · higher volume · less manual | Closing |
| **Bank reconciliation** | Automated · AI-assisted matching · PDF bank statement import | PDF to Excel conversion only · no automated reconciliation | Alegra wins |
| **Fiscal compliance dashboard (semáforo)** | Launching now · e-firma + opinión de cumplimiento | Core feature · more data depth today | Closing |
| **Automatic accounting (contabilización masiva)** | Launched · AI-suggested account coding from history | Available | Parity |
| **Payroll timbrado (nómina)** | Under evaluation · ~1 month to build once greenlit | Included in premium plan | Open |
| **ISR provisional tax calculations** | Research phase | Automated | Open |
| **Pyme-facing product (invoicing + ops)** | Full product — strong differentiator | Not built · 100% contador-only | Alegra wins |
| **Client communication & doc requests** | Sends info to SMBs today · portal in discovery | WhatsApp icon only · no real workflow | Closing |
| **Team permissions & multi-user** | Issues resolved · granular permissions improving | Available | Parity |

*Key insight from field research: when the first XML download fails in a demo, accountants move on without a second chance. Fixing SAT connection reliability is the #1 conversion lever — ahead of any other feature gap.*

# Discussion

## AI in Product: Current Usage & Next Steps (Agents)

ARCHITECTURE, NOT FEATURES

# The 4 AI capabilities

These are not independent features — they are the four pillars the product is built on

## 01
### Reconciliation

Automatic matching of bank movements, invoices and payments. The system proposes matches, learns from corrections, and gets more accurate over time. Reduces end-of-month closing from days to hours.

LIVE

## 02
### Classification

Intelligent categorization of transactions, expenses and income. Learns from each business's behavior and accounting patterns. The more it's used, the less the user has to touch. Manual rework drops from day one.

LIVE

## 03
### Synchronization

Real-time orchestration of data across banks, vendors, clients and tax authorities. The layer that keeps everything current without the user having to trigger it. No more stale data at month close.

IN PROGRESS

## 04
### Conversation

A conversational interface that replaces menus. The user asks questions, gives orders and gets answers in natural language — via the app or WhatsApp. The interface that makes the other three capabilities accessible to anyone.

POC

THE VISION

# Alegra as the operating system of the business

The user doesn't configure software. They give orders to Alegra.

### See without searching

Proactive summaries, relevant alerts and business analysis appear on their own — no report to build.

### Act without navigating

The user gives a natural-language order or a WhatsApp message. Alegra executes, confirms and records. The menu disappears.

### Learn without configuring

Alegra learns from each business's behavior. Personalization happens on its own — no manual setup required.

THREE PRINCIPLES THAT GUIDE HOW WE BUILD

**1**

### Visible magic

When Alegra acts autonomously, the user must see it happen. Invisible magic doesn't build trust — visible magic builds loyalty.

→ *Activity feed required on every agentic action*

**2**

### Smart defaults, optional personalization

First we prove the default behavior works well. Only then do we give controls to adjust it. Trust before configuration.

→ *Personalization is H2, not H1*

**3**

### One model, multiple channels

Alegra's intelligence lives in one place. WhatsApp, the app, MCP — windows into the same agent, not separate products.

→ *Orchestration architecture before more channels*

D1

## Align on a unified AI vision

Confirm that Alegra AI is one product with multiple channels — not scattered features by team. This shapes architecture, naming, and prioritization across the company.

DIRECTION

D2

## Prioritize the user trust layer

Users need to see what the AI is doing, control how it behaves for their business, and access it from wherever they work — the app, WhatsApp, or any future channel. Activity feed, personalization and omnichannel experience need to move together.

CRITICAL

D3

## Coordinate teams on orchestration architecture

Integrations, Product and Tech are building in parallel — excellent work that needs to converge on one shared architecture before we scale, or we'll rebuild it twice.
